

Capstone 2- Issues Document

1. Variables

- Incorrect use of var instead of let or const for variable declarations
- Some variable declarations do not have var, let or const
- There are scoping issues in the code

2. Classes

- There is a constructor with a missing id property on line 14 of [app.js](#)
- There is a missing super call in line 28 of [app.js](#)
- There is missing method to toggle completion
- There is an object with missing array methods and a method to add tasks

3. Template literals

- Used incorrect string concatenation instead of template literals

4. Functions

- There is a function with no error handling on [app.js](#)
- The function addTask uses var instead of const
- The displayAllTasks function has an incorrect loop which should be for...of instead
- The for loop also uses var instead of let
- This for loop also has an off-by-one error
- The function findTaskByTitle a title parameter, and the loop is incorrectly structured
- The updateTaskPriority function is missing the typeof check for parameters
- The calculateAveragePriority is missing a check for empty arrays, and it should use Math.round or toFixed

5. Operators

- Uses the equality operator (==) instead of the strict equality operator (===) in line 57 of app.js
- Missing an increment operator (i++)
- Uses the assignment operator (=) instead of the strict equality operator
- The mergeTasks function is missing spread/rest operators

6. Destructuring

- The function `getTaskDetails` does not destructure task properties

7. Recursion

- The function `countCompletedTasks` does not have a base case
- It is also missing a null/undefined check

8. High-order functions

- `getHighPriorityTasks` should use the filter method
- There is an object on [app.js](#) line 144 which is missing array methods

9. Modules

- [apps.js](#) is missing proper export modules
- There are missing export and import modules throughout the app

10. Tests

- The tests are missing property checks
- The `getInfo` method and toggle completion tests are missing
- Tests are missing for a lot of the functions
- Some tests contain the wrong assertion
- There is a missing `beforeEach` which is supposed to reset the task list
- The blocks for 'SubTask class and inheritance', destructuring functions, spread/rest operator functions, and module exports/imports should be described

11. DOM Manipulation

- Incorrect selector methods are used
- There are missing null checks before listeners
- Other event listeners for form submission are also missing
- The `handleAddTask` is missing validation and `event.preventDefault()`
- There are missing inputs on line 26 and 31
- There are functions with event handling issues
- The app is also missing JSON conversion functions and functions to save/load tasks from `localStorage`
- The `setupEventListeners()` should use `DOMContentLoaded`

12. Form

- Missing a priority input
- Button is incorrect

13. HTML page

- Missing a statistics display
- The scripts are loaded in the wrong order
- There is a missing module script
